Case study: improving masking for electroless nickel plating in aerospace and defense applications

An international company who specialise in manufacturing and repairing landing gear and actuation systems for the aerospace market were looking for efficiencies in their electroless nickel plating process – their target was to automate the masking process and increase throughput. The adoption of Dymax SpeedMask brought process times down from as much as three days to less than 45 minutes. Read how they achieved this in our latest case study (pdf):
