

ACCU-CAL™ 50-LED Radiometer

Consistent light curing requires periodic monitoring of light energy intensity and dosage levels. The ACCU-CAL™ 50-LED radiometer is simple to operate and offers accurate measurement of curing energy. The ACCU-CAL™ 50-LED can measure energy levels emitted from lightguides (3 mm, 5 mm, and 8 mm) and LED flood lamps. A spectral sensitivity range of 350 - 450 nm and intensity measurement from 1 mW/cm² to 40 W/cm², makes this unit ideal for measuring LED curing source energy levels. A specially designed photo-sensor assembly provides repeatable measurements and protection from high temperatures associated with some LED systems on the market.

Three Reasons to Use a Radiometer

- **Maintaining a Reliable Light-Curing Process** – A radiometer helps to ensure that a light-curing system is providing the intensity and dosage levels required for successful curing.
- **Providing a Worker-Friendly Light-Curing Process** – The ACCU-CAL™ 50-LED is sufficiently sensitive to measure the intensity of stray or reflected energy (as little as 1 mW/cm²). DYMAX recommends that worker UVA exposure not exceed 1 mW/cm². For reference, UV (320-395 nm) intensity on a sunny day can range from 2-6 mW/cm².
- **Measuring Transmission Rates Through Substrates** – A radiometer can be used to measure the transmission rates of various wavelengths through substrates that sometimes absorb various frequencies of energy. To assure an effective curing process it is critical to measure the light intensity reaching the cure site below any intervening substrate.
